

WOBAR

WORLD VISUALS

THE WORLD

A few things that make it feel like Wobar to me:

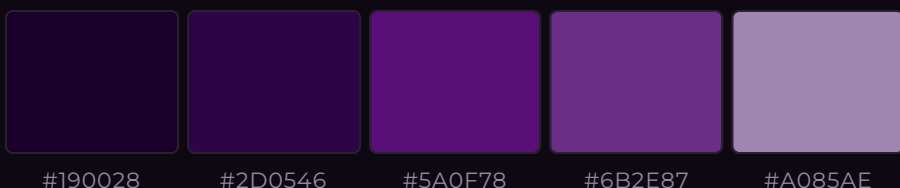

- It's all lines. Wireframe is what the world is made of.
- At the show you're inside the structure, so it should fill the whole frame instead of being one object in the middle. That also means it holds up however it gets cropped, which matters (more on that in the specs).
- Color stays muted. I'd rather the disorientation come from the lines and the contrast than from saturation. Palettes on the next page.
- Stuff that pulls it out of the world for me: people, faces, recognizable objects, mandala or kaleidoscope stuff, space and nebulas, synthwave grids, text.

PALETTES

Four palettes to start from. Each one runs dark to light, shadows on the left, brightest highlight on the right.

PURPLE

GREEN

BLUE

RUST

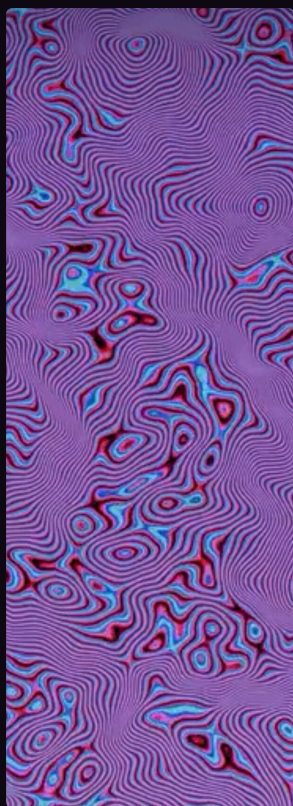

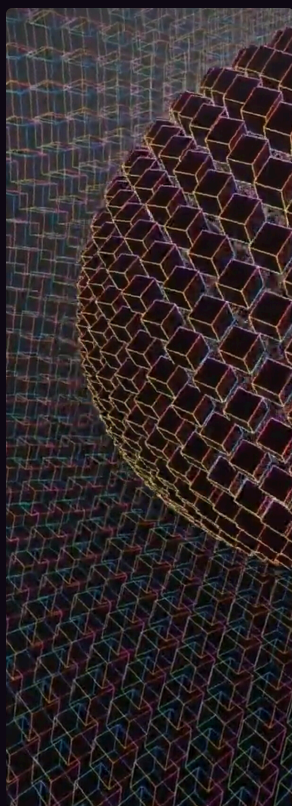

Even the brightest color is never pure white, and nothing's neon.

REFERENCES

These three are yours, and they're what got me reaching out. What I love in all of them is the movement. Hypnotic, kind of hard to look at in a good way, your eye never really lands anywhere. For Wobar I'd take the color more muted, like the palettes above.

WHAT I'M LOOKING FOR FIRST

Four loops, one for each energy level: low, building, peak, settling. What they look like and how they move is up to you. Peak is the one where the world can start breaking apart.

Before you build anything, I'd love to just hear how you'd approach it. A quick explanation is perfect. If it clicks, we go from there.

S P E C S

- 140 BPM, locked to the bar. Each loop is 16 bars (64 beats, about 27.4 seconds) and loops clean.
- 30 fps.
- These are going to end up on all kinds of screens: wide, vertical, square, weird LED shapes. I'll cut the vertical versions out of the middle of the wide frame myself, so it has to hold up if I crop a vertical slice out of the center.
- For each loop:
 - 3840×2160 MP4, 10-bit, high bitrate
 - graded and grayscale versions
 - project files
- If you can set it up so things like speed, density and displacement are easy to dial in later, that'd be huge. Eventually I want this reacting to the music live.

WHERE THIS GOES

This starts as a paid job for four loops, but honestly I'm not just looking for loops. I'm looking for someone to build the live side of Wobar with me. Down the line that's a fully audio-reactive show and someone on the team running it. If this world clicks for you and that sounds like something you'd want, the door's open.

We'll sort out budget and timing when we talk, and I want all of that settled before you start anything. I want to make sure you're well paid for this.
